Before string theory introduced the concept of extra dimensions, the fascination with strange warping of space in the 1800s was perhaps nowhere as clear as in the creation of non-Euclidean geometry, where mathematicians began to explore new types of geometry that weren't based on the rules laid out 2,000 years earlier by Euclid. One version of non-Euclidean geometry is Riemannian geometry, but there are others, such as projective geometry.

### **Non Euclidean geometry Wikipedia**

By formulating the geometry in terms of a curvature tensor, Riemann allowed non-Euclidean geometry to be applied to higher dimensions. Beltrami (1868) was the first to apply Riemann's geometry to spaces of negative curvature. Terminology. It was Gauss who coined the term "non-Euclidean geometry".

A non-Euclidean geometry is a rethinking and redescription of the properties of things like points, lines, and other shapes in a non-flat world. Spherical geometry which is sort of plane geometry warped onto the surface of a sphere is one example of a non-Euclidean geometry.

Non-Euclidean geometry is the term used to refer to two specific geometries which are, loosely speaking, obtained by negating the Euclidean parallel postulate, namely hyperbolic and elliptic geometry.

### **Non Euclidean Dr Mark Liu**

Non-Euclidean geometry is the modern mathematics of curved surfaces. Developed in the 19th century it forced mathematicians to understand that curved surfaces have completely different rules and geometric properties to flat surfaces. Most of us are familiar with Euclidean geometry from high school, but never learn Non-Euclidean geometry unless we study mathematics or science degrees. Most fashion designers are not familiar with advanced Non-Euclidean geometry.
